

# Security Team Works Faster for 200% ROI with Polarity

## Challenge

The customer operates a lean security organization within a multi-billion dollar Financial Services company with a global SOC and US-based Incident Response team. The team works in a highly collaborative “Fusion Center” model where efficiency is an important driver. The industry is competitive, so optimizing the output from the team is key to aligning with the corporate strategy.

It's not unusual for the team to handle hundreds of events per day working across more than twenty-five different security products. Integration between these disparate products is limited, which affects the efficiency and effectiveness of collaboration across the team.

For example, when researching an IOC, an analyst might need context from four different tools. Even for an experienced analyst, it's a challenge to keep track of all the sources, and it takes time to pivot from product to product when doing the job.

While speed or efficiency is critical, it's also important to be thorough. The skill set of the team is mixed with seasoned analysts who are well versed at handling events, plus less experienced analysts who are learning on the job. It's important to share knowledge across the team as a means of developing the less experienced analysts and balancing the load for the seasoned pros.

While the team had not budgeted for Polarity in their annual planning, it was hard to pass up the opportunity to improve the thoroughness and speed of their work.

## Solution

Data tells a story, Polarity helps you see it with software-based Augmented Reality overlaying contextual information as you work. When analysts use Polarity, they are better equipped to make thorough decisions and take action with speed.

Polarity helps you find the right data to make better decisions. It's about being thorough; knowing what is available from past analysis completed by you and your teammates, as well as all the context provided by the security products used day-to-day.

Polarity has helped the team integrate security products from a wide range of vendors, so context is overlaid during analysis and action is seamlessly taken once decisions are made. For example, when triaging events affecting corporate users, relevant context like user account details from LDAP are automatically displayed by Polarity on screen. This saves time and improves accuracy since all the information available to research an IOC is available exactly when it is needed versus searching across several different sources.

**“Our investment in Polarity led to an annual ROI of nearly 200% based on just its initial use cases. Since purchase, we continue to find ways to use Polarity to increase the speed and thoroughness of the team.”**

**Cybersecurity Manager**  
Financial Service Company

The Polarity open-source integration framework supports more than 100 security products enabling the team to connect their SIEM, TIP, EDR, LDAP, and a number of other products. Though the team is technical, Polarity's ability to integrate these products without requiring them to write code is an important advantage over other approaches. The integration framework also enables the team to support proprietary applications and even customize the way results appear.

Polarity also helps you get the data needed to act quickly. It's about working fast; having the ability to retrieve relevant context exactly when it is needed to make a decision.

With Polarity the team sees relevant context overlaid on screen as they are working. For example, instead of searching across four different tools for information related to an IOC, important context is instantly displayed on the analyst's screen. The team also uses Polarity Annotations which allow an analyst to easily recall important details from a past investigation as well as share those same details across the entire team.

The relationship between the client and Polarity began with a Proof of Concept, and quickly moved into production as the team realized how improved thoroughness and speed when working with data could impact their work and the company's bottom line.

## Result

The team created a detailed ROI analysis based on time study comparison data they were able to collect during the Proof of Concept. The results clearly showed an advantage when using Polarity.

For example, the analysis showed that time spent gathering context when investigating IOCs from a phishing email or SIEM alert could be reduced by more than 60%. Similarly, time spent on subnet or asset name lookups related to building reference sets could be reduced by nearly 90%.

With a team that handles hundreds of IOCs and reference sets each day, the ROI from working faster and more thoroughly adds up. Polarity's annual ROI was calculated at 200%, and the project yielded a 6 month payback period. Although Polarity was not budgeted in the team's annual plan, they were able to support the purchase based on the strength of the business case and support for corporate initiatives tied to efficiency.

Though the initial business case was based only on a few use cases, the team has since found dozens of ways to use Polarity. The efficiency gains are so pronounced that management has even noticed performance differences between analysts; those using Polarity are able to meet time and quality SLAs more consistently than those who do not use it.

Working from a great foundation, the team continues to evaluate additional use cases for Polarity including those associated with Risk Management, and even how Polarity could be used by departments beyond the scope of security, such as overlaying information on contracts for the Legal team. Polarity has helped deliver the right data needed to complete the job, exactly when it is needed.

# POLARITY

## About Polarity

Data tells a story, Polarity helps you see it with software-based Augmented Reality overlaying contextual information as you work. No glasses or goggles are needed. When analysts use Polarity, they are better equipped to make thorough decisions and take action with speed.
